

LOC T-Harnesses have vehicle specific applications. Please visit <https://axxessinterfaces.com/> for the latest and up-to-date application information.

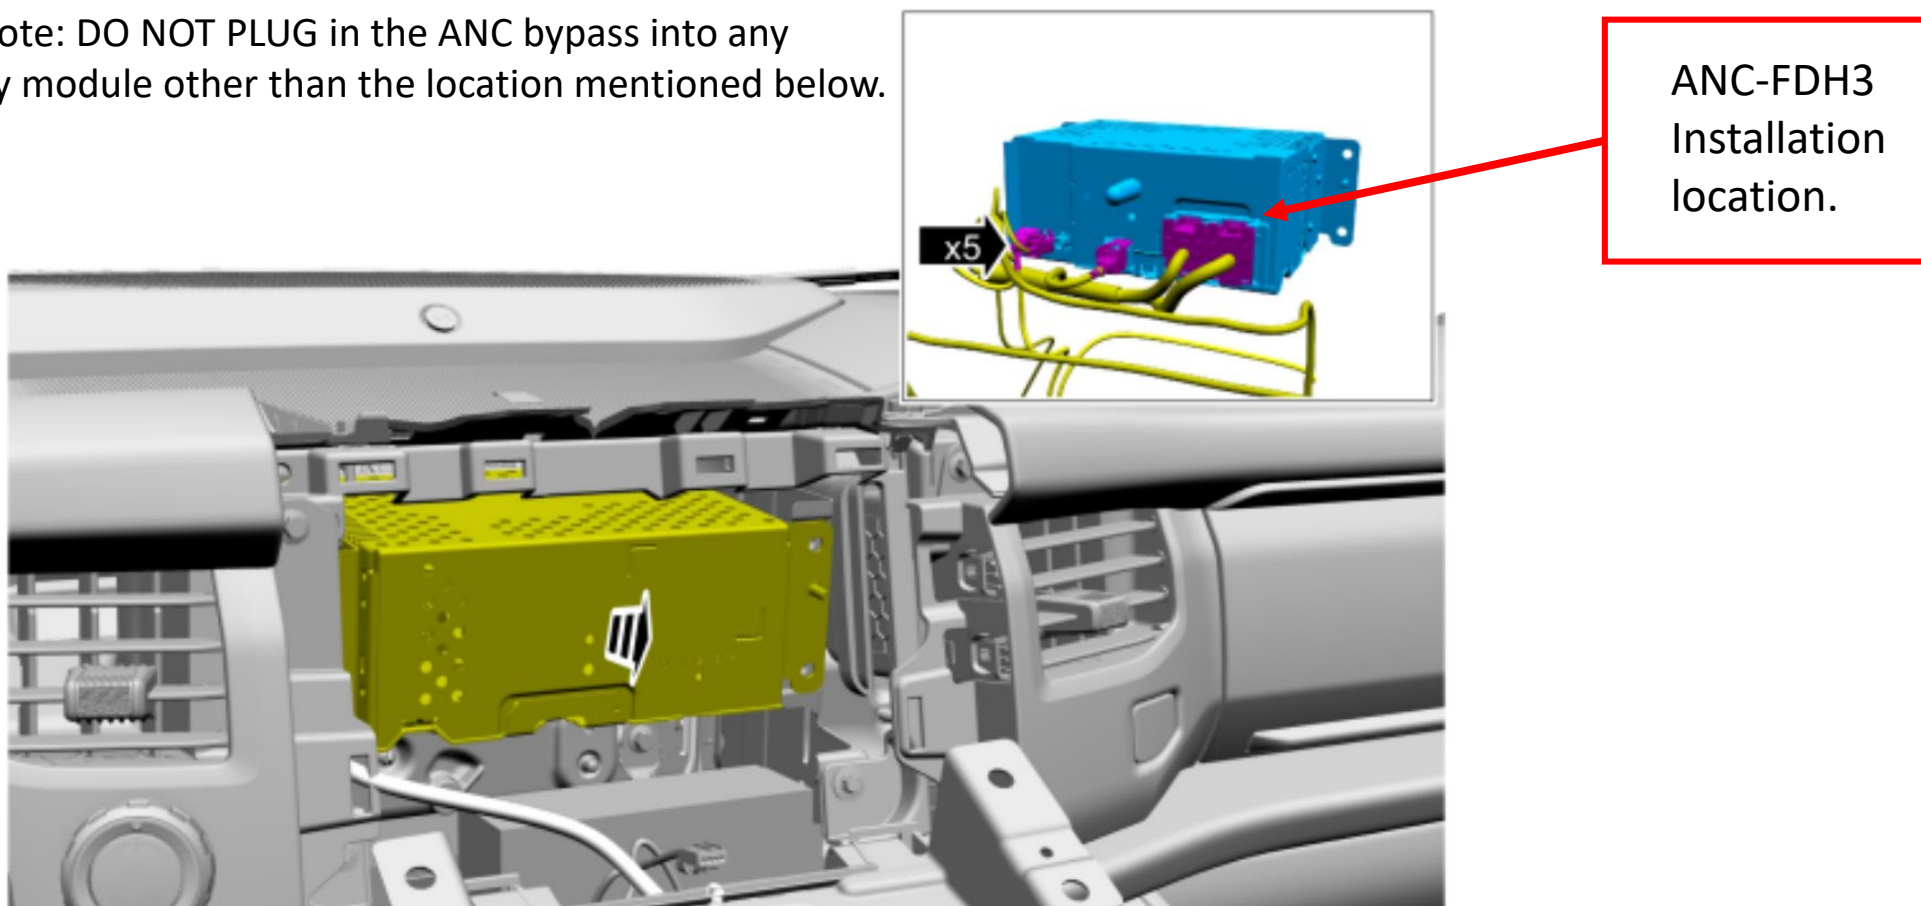

Things to know

Active noise cancellation is an OE module that helps reduce unwanted background noise. Microphones mounted throughout the vehicles are used to monitor sound levels and frequencies inside the vehicle's cabin. The factory ANC generates an inverted signal from the factory speakers to cancel out unwanted cabin noise.

The installation of this harness is done at the ACM (Radio Brick in Dash).

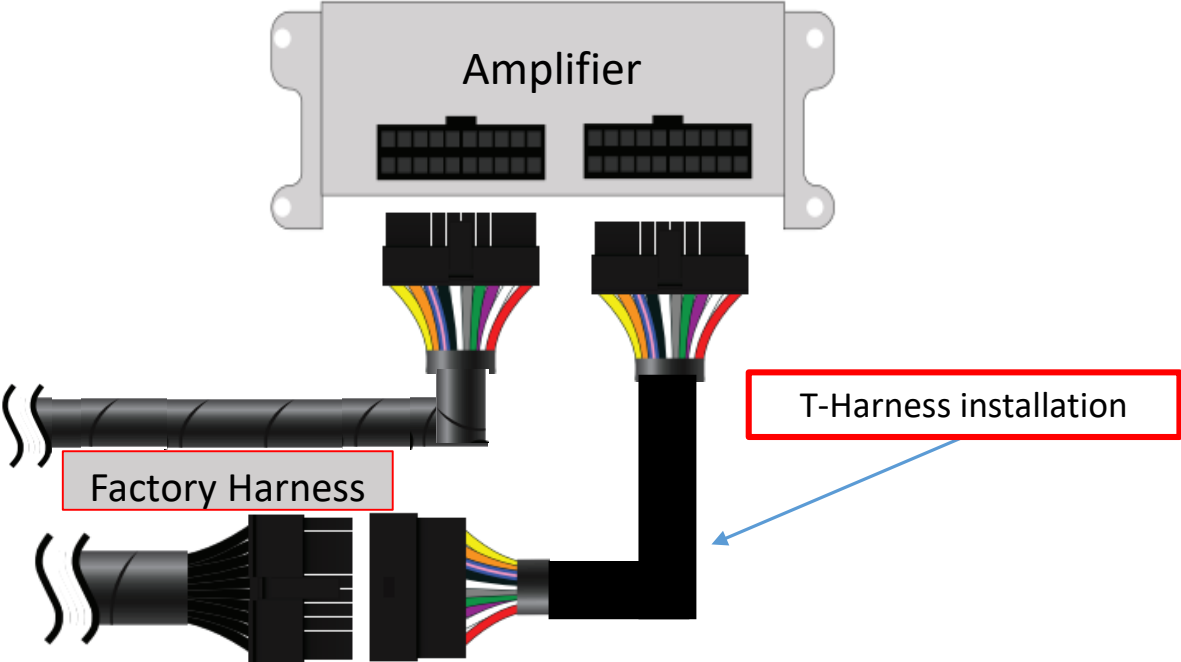

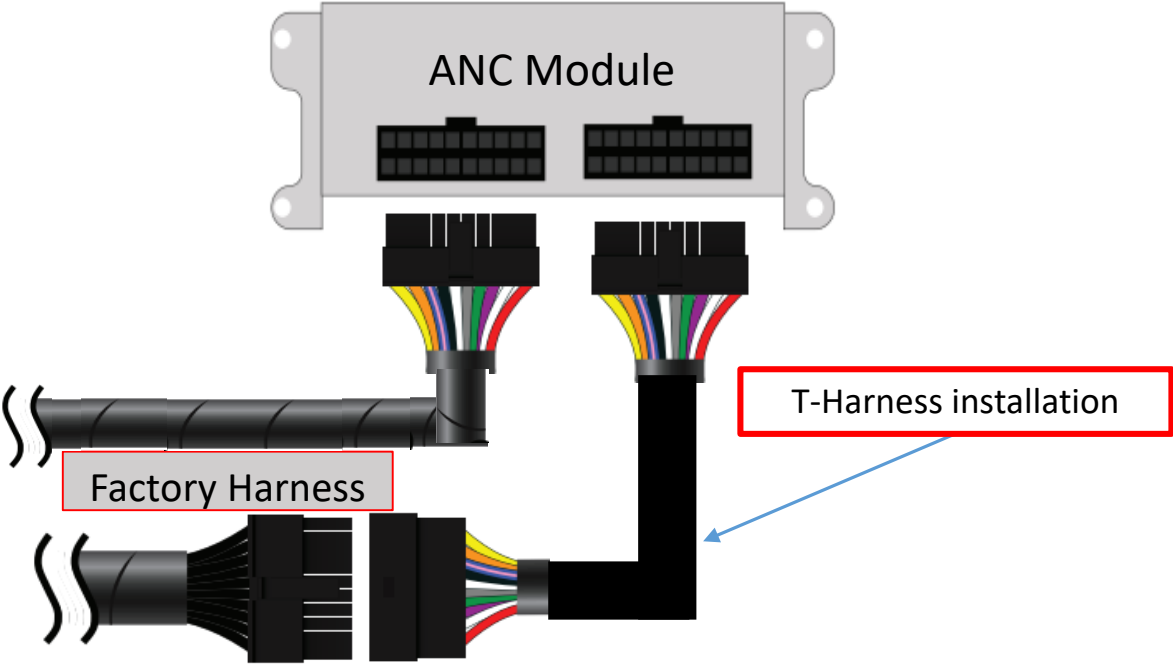

Active Noise Canceling Microphones (ANC) is an audio system feature that reduces the level of occasional low frequency engine noises which compete with audio system playback. The system uses 3 microphones, the ACM and the audio system speakers.

Important Note: DO NOT PLUG in the ANC bypass into any other factory module other than the location mentioned below.

Bypassing ANC

In some amplified vehicles the ANC module is inside the factory amplifier(s).
